(Crystallo-graphic Symmetry)
First, consider space groups and atom numbers. This material [chemical formula] should have the space group [space group]. … has … sites: one site has … atoms. ……

(Local Coordination Environments)
Second, consider band gaps. …… … is bonded in a … geometry to … equivalent … and … equivalent … atoms. All … bond lengths are … Å. ……

(Predicted Functional Properties)
Third, consider structure validity. The structure is reasonable, because the bond lengths are all greater than …, and the structure's volume … is larger than ….

Thermodynamic Status: It is predicted to be thermodynamically stable (on the hull). The formation energy per atom is -…… eV/atom.
Classification: This material is classified as a metal, confirmed by its zero band gap and a Fermi energy (E_F) of …… eV.
